**Shashank Sagar 's Approach :**

- He used python IDLE for writing the code and queries.Imported pymongo library
- He created a database named AssignmentMongoDB and created various collections to store the data in them.
- He imported the data in the collections. Task1_and_task2.py contains the code for this operation.
- His task3.py contains the code for insertion of new data in the respective Collection.
- Task4_a.py contains the queries for task 4.a - i,ii,iii.
- Task4_b.py contains the queries for task 4.b - i,ii,iii,iv
- Task4_c.py contains the queries for task 4.c - i,ii

**Nikhil Y M 's Approach :**

- He used python IDLE for writing the code and queries.Imported pymongo library
- He created a database named film_data_db and created various collections to store the data in them.
- He imported the data in the collections. main.py contains the code for this operation.
- His new_data_insertion.py contains the code for insertion of new data in the respective
  Collection.
- 4a_comments.py contains the queries for task 4.a - i,ii,iii.
- 4b_movies.py contains the queries for task 4.b - i,ii,iii,iv

- 4c_theaters.pycontains the queries for task 4.c - i,ii

Both Approaches are similar to my approach . Queries for tasks also contains same logic.
